Instruction Manual for the "Not" Theory Mar 12 2021 The "Not" Theory raises the question, "How can one be free from intellectual constraints?" It then gives a basic, elementary response and reasoning. This begs the question, "Is it correct?" You will not find the answer here. Instead, the book is an instruction manual/preparation guide/workbook for testing the "Not" Theory: a structure to bring together a group of 7 artists (from any medium) to create an art project of any kind (i.e. a series of paintings, sculptures, poems, photographs, a video, theater, dance, multi-media project, etc.) It is broken down into three phases: Constraints (X), Destruction (Adding Y to X), and Freedom. The group must experience Phase I together, in the format given. However, Phase II and III cannot be forced onto the group. They must choose to continue testing the theory. Last question: "Is freedom possible?" It is up to you to determine.

Continuum Electromechanics Jan 10 2021 Designed to be used as a graduate-level text and as an engineering reference work, "Continuum Electromechanics" presents a comprehensive development of its subject--the interaction of electromagnetic forces and ponderable media, the mechanical responses to electromagnetic fields, and the reciprocal effects of the material motions produced by those fields. The author's approach is highly interdisciplinary, and he introduces fundamental concepts from such subjects as electrohydrodynamics, magnetohydrodynamics, plasma physics, electron beam engineering, fluid mechanics, heat transfer, and physical chemistry. The applications of continuum electromechanics are also remarkably diverse, and many of them are treated in the book, both because of their intrinsic engineering importance and as a means of illustrating basic principles. Among these applications are the design of rotating machines and synchronous generators, polymer processing, magnetic melting and pumping in metallurgical operations, the processing of plastics and glass, the manufacture of synthetic fibers, inductive and dielectric heating, thermal-to-electrical energy conversion, the control of air pollution, the design of controlled-fusion devices, image processing and printing, the magnetic levitation and propulsion of vehicles, the study of films and membranes, and the analysis of the complex electrokinetic and physicochemical processes that underlie the sensing and motor functions of biological systems. Many of these applications are presented in the form of problems. The book consists of eleven chapters, entitled Introduction to Continuum Electromechanics; Electrodynamics Laws; Approximations, and Relations; Electromagnetic Forces, Force Densities, and Stress Tensors; Electromechanical Kinematics; Energy-Conversion Models and Processes; Charge Migration, Convection, and Relaxation; Magnetic Diffusion and Induction Interactions; Laws, Approximations, and Relations of Fluid Mechanics Statics and Dynamics of Systems Having a Static Equilibrium; Electromechanical Flows; Electromechanics with

Thermal and Molecular Diffusion; and Streaming Interactions.
