undefined terms a point has no length no width and no height a line has length but no width and no height a plane has length and width but no height using these undefined terms we create all of geometry from there as you note they really do not exist but that does not mean that we geometry the branch of mathematics concerned with the shape of individual objects spatial relationships among various objects and the properties of surrounding space geometry is the branch of mathematics that relates the principles covering distances angles patterns areas and volumes all the visually and spatially related concepts are categorized under geometry there are three types of geometry euclidean there are five in euclidean geometry that any two points can be connected by a straight line that any line segment can be stretched out forever in either direction that we can always define a circle given a center and a radius that all right angles are congruent and that for any line and any point not on that line there is exactly one line
