Over the past decade, there have been a large number of important studies related to fluid management for the surgical patient, resulting in confusion on this critical aspect of patient care. However in many cases IVF is not feasible and may not be indicated. IVF remains a largely inefficient procedure that often does not succeed in achieving a pregnancy. There remains a strong place for other fertility interventions, many of them surgical in nature. Surgical interventions can be used as a stand-alone fertility treatment or as an adjuvant treatment used in conjunction with other assisted conception treatments. Despite the continuing use of such techniques by reproductive surgeons, there remains a clear gap in the literature regarding resources to supplement formal training in the field or to provide a reference for established and aspiring practitioners. This book provides a unique tool for approaching cranio-vertebral junction (CVJ) surgery. Following a brief introduction to the relevant anatomy and biomechanics of CVJ, it explores the field of cranio-vertebral junction lesions and their management. Furthermore, individual chapters cover endovascular surgery, endoscopic skull base techniques, navigation and robotics, ensuring that surgeons stay up-to-date. A chapter addressing the consequences of CVJ surgery with regard to sagittal balance is of particular importance. The book is structured according both to the type of lesion involving the CVJ (tumor, trauma), and to the type of surgical approach (anterior, posterior). Further, it reflects innovative treatment modalities that have improved patient safety and efficacy rates for surgery involving the CVJ, and covers both open and minimally invasive surgical methods, enabling surgeons to hone their skills in both areas. When I gave a presentation on return to work after heart valve replacement at the Tenth Congress of the German Society for Thoracic and Cardiovascular Surgery in 1981, I was surprised by the relatively low level of interest that cardiac surgeons seemed to have in this subject. This stimulated me to intensify my research in this area and to extend it to patients with coron ary heart disease. Obviously, physiological and mechanical aspects of medical treatment are of special interest to the surgeon. For the majority of cardiac surgical patients, that is those with coronary heart disease, the technical problems of the operative procedure have been solved to a great extent. Many studies have demonstrated that, aside from reduction of symptoms, aortocoronary bypass operation can lead to improvement of cardiac performance un der stress conditions. However in spite of the technical solutions to hemodynamic problems, it has become very clear that the reintegration of patients into their social sphere has not been accomplished to the extent that might be expected, as exempli fied by the relatively low rate of postoperative return to work. This issue of Anesthesiology Clinics focuses on Preoperative Evaluation. Topics will include: Preoperative Clinics, Consultations, Informed Consent/Shared Decision Making, Preoperative Labs, Evaluation of Major Organ Systems, Special Considerations, and Innovative treatment/preparation programs
